

NO-Mite

300g NET

NO-Mite is an effective and safe method of eradicating Red Mite in all avian housing situations.

Made of ingredients commonly used in the food industry, **NO-Mite** is not dangerous for eggs, humans, hens/birds or the environment according to regulation 1999/45/CE.

NO-Mite can be used in organic farming according to the agreement CEE n°2092/91 of June 24 1991.

Red mite do not live on birds, they come out at night from their resting places and make their way to the bird to feed. Treating the red mites resting places and routes taken to engage the birds is the most effective way of eliminating the parasite.

NO-Mite kills mites in a mechanical manner where contact with the powder causes physical harm as well as adsorbing water from them therefore resistance to the product is impossible unlike pesticides.

Two and possibly three treatments are normally required to break the life cycle of the mites initially as seldom 100% of all hiding places are achieved in the first treatment.

How to apply:

The most common application method of **NO-Mite** is in the powder form with your typical talcum powder dispenser. Simply sprinkle the powder onto the desired areas (i.e mite hiding places and migratory track).

NO-Mite can be mixed with warm water at a **maximum** rate of 80% water: 20% **NO-Mite** and sprayed on surfaces at a rate that gives a frosted look, this application method is not necessary but sometimes used on vertical surfaces. Mixing rates vary depending on the sprayer type.
